

Assignment Overview

XYZ bank still has a number of legacy systems causing poor customer experience. So the bank decided to migrate legacy systems to advanced systems.

As part of their digital initiative, a new trail project is launched with the objective that customer can open a new account/login to existing account remotely using any electronic device and able to do transactions.

Design an application which uses Rest services for all functionalities using Java, Spring Boot and any database.

Functional requirement

- ✓ Customer must be able to register to bank with basic details.
- ✓ Customer must be able to login with the selected username and default password(auto generated).
- ✓ Customer must be able to upload ID document (size check should be there with a format)
- ✓ Customer should not be wait for file upload to complete while registering
- ✓ Once customer is registered automatically **Unique** account number (16 characters - starting with ABNA) should be assigned.
- ✓ Any customer outside Netherlands and Belgium must not be able to register and create account
- ✓ Customers above 18 year age are only allowed to register and create account
- ✓ Customer must be able to see some account details like account balance and type of account
- ✓ Customer must be able to download ID document

APIs overview

API Endpoint	Responsibility	Expected Output
http://localhost:8080/register or http://localhost:8080/login	Register customer / Login using token	Returns success response with user name and random password Return failed response with proper message in case of failures
http://localhost:8080/overview	Provide customer overview	Account overview which returns account number, account type, balance, and currency
And other endpoints based on functionality.		

Please note there might be other internal backend APIs needed to meet all the functional requirements but only these ones are exposed APIs

Technical Requirement

- ✓ Design a Spring boot application with rest services
- ✓ Use Java 21 or above (apply latest features where applicable)

- ✓ Use MySQL or any database
- ✓ All validations must be handled properly
- ✓ All error messages must be in generic format
- ✓ Junit must be written for all functionalities
- ✓ Above API's must work with all scenarios

Deliverables :

Git public repository link for code and documentation.

Document should have clear instruction to run application on any local machine

Bonus points for :

- Thought out design
- Clean and defect free code
- Code coverage more than 80 %(meaningful JUnit)
